DETAILED ACTION

- 1. The response of 9/28/04 has been received and considered.
- 2. Claims 1-14 are pending.

Response to Arguments

- 3. In light of applicant's amendment, the rejection of claim 14 under 35 U.S.C. §112 is withdrawn.
- 4. Applicant's arguments filed 9/28/04 have been fully considered but are not persuasive.
- Regarding applicant's arguments (pp. 9-10, §B), applicant argues that motivation does not exist to use the Park reference because, as amended, the claims recite a single state object. Park teaches securing the cookies used on the web (state objects), by providing integrity (p. 39). Park's example includes multiple cookies being used where the last cookie includes integrity information about the other cookies (Fig. 3), signed with a server's private key (p. 40). However, the cookies listed in Fig. 3 are used as an example and are not required. Further, Park teaches that the user sends the relevant secure cookies to the server (p. 40). This data being sent can be viewed as a single state object. The Seal_Cookie is simply a digital signature on another cookie; the information sent by the user to the server is simply data and a digital signature on that data. It is this concept that Park teaches.

Further, applicant is directed to Gaur, p. 3. Gaur teaches that some web sites split one cookie into many cookies that are further encrypted; this is well known in the art. Multiple cookies can and do act as a single state object.

Art Unit: 2134

Claim Rejections - 35 USC § 103

6. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 7. Claims 1-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. Patent 6,134,592 to Montulli in view of "Assessing the Security of Your Web Applications" by Gaur in view of "Secure Cookies on the Web" by Park et al. (Park) in view of Applied Cryptography, Second Edition, by Schneier.

Regarding claims 1-5, Montulli discloses providing a client communicating a client request to said server/Web server to perform a server action/http request, said server responsive to receiving said client request, performing said server action/http request and creating a state object/cookie containing post-action state information, communicating said state object/cookie and a result of said server action/html document to said client, and storing said encrypted state object in said client memory, said client communicating a subsequent request to said server to perform a server action and said server receiving from said client said state object with said subsequent client request (col. 7, lines 33-50). Montulli lacks encrypting the cookie. However, Gaur teaches that to avoid a user gaining unauthorized access to personal information in cookies, one security measure is encrypting the cookie (page 3, §The security measures you can take are). Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to encrypt the cookie before sending it to the client and storing the encrypted cookie in the client memory. One of ordinary skill in the art would have been motivated to

Art Unit: 2134

perform such a modification to prevent unauthorized access to personal information, as taught by Gaur. As modified, Montulli lacks an asymmetric encryption method having a public key provided to said client said server and a private key provided to said server and encrypting said state object using said private key. However, Park teaches that an attacker can edit cookies and use them to impersonate the true owner of the cookie (page 39, §Providing Integrity). To prevent this, a server can issue the cookie with a digest to be later verified (that the cookie hasn't been modified) when the user presents the cookie (page 40-41, §Public-key-based solution). Park does not teach signing the whole key. However, Schneier teaches that one way to verify a document/cookie is to encrypt the document with the private key of a public key pair; the document is verified when it is successfully decrypted using the public key (page 37, §Signing Documents with Public-Key Cryptography). Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to encrypt the state object/cookie using the private key of the server and to decrypt the received encrypted state object/cookie using the server public key. One of ordinary skill in the art would have been motivated to perform such a modification to prevent impersonation, as taught by Park (page 39, §Providing Integrity & page 40-41, §Public-key-based solution) and to verify the key, as taught by Schneier (page 37, §Signing Documents with Public-Key Cryptography).

Regarding claim 6, Montulli, as modified above, discloses using state information contained therein to perform the requested action (col. 7, lines 33-61), responsive to performing the requested action, replacing previous state information with new state information in said state object, encrypting said state object with said private key and sending said encrypted state object and a result of said server action to the client (col. 9, lines 38-63).

Regarding claims 7-10, the claims are substantially equivalent to claims 1-6. Therefore, claims 7-10 are rejected under similar rationale.

Regarding claims 11-14, as best understood, the claims are substantially equivalent to claims 1-6. Therefore, claims 11-14 are rejected under similar rationale.

Double Patenting

8. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. See *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and, *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent is shown to be commonly owned with this application. See 37 CFR 1.130(b).

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

9. Claims 1-14, are rejected under the judicially created doctrine of obviousness-type double patenting as being unpatentable over claim 2 of U.S. Patent No. 6,065,117 to White in view of "Secure Cookies on the Web" by Park et al. (Park) in view of <u>Applied Cryptography, Second Edition</u>, by Schneier.

Regarding claims 1-5, 7-8, 11-12 & 14, White discloses a method/system equivalent to the claimed method/system, but lacks using asymmetric cryptography. However, Park teaches that an attacker can edit cookies and use them to impersonate the true owner of the cookie (page 39, §Providing Integrity). To prevent this, a server can issue the cookie with a digest to be later verified (that the cookie hasn't been modified) when the user presents the cookie (page 40-41,

Art Unit: 2134

§Public-key-based solution). Park does not teach signing the whole key. However, Schneier teaches that one way to verify a document/cookie is to encrypt the document with the private key of a public key pair; the document is verified when it is successfully decrypted using the public key (page 37, §Signing Documents with Public-Key Cryptography). Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to encrypt the state object/cookie using the private key of the server and to decrypt the received encrypted state object/cookie using the server public key. One of ordinary skill in the art would have been motivated to perform such a modification to prevent impersonation, as taught by Park (page 39, §Providing Integrity & page 40-41, §Public-key-based solution) and to verify the key, as taught by Schneier (page 37, §Signing Documents with Public-Key Cryptography).

Regarding claims 6, 9-10 & 13, White lacks replacing previous state information with new state information. However, Park teaches that a web server can update cookies' contents whenever the user visits the server (p. 37, §Cookies). This is to maintain continuity and state on the web (p. 36, ¶2). Therefore, it would have been obvious to one having ordinary skill in the art at the time the invention was made to replace previous state information with new state information. One of ordinary skill in the art would have been motivated to perform such a modification to maintain continuity and state on the web, as taught by Park (p. 36, ¶2 & p. 37, §Cookies).

Art Unit: 2134

Conclusion

10. Applicant's amendment necessitated the new ground(s) of rejection presented in this Office action. Accordingly, **THIS ACTION IS MADE FINAL**. See MPEP § 706.07(a). Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the date of this final action.

11. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Michael J. Simitoski whose telephone number is (571) 272-3841. The examiner can normally be reached on Monday - Thursday, 6:45 a.m. - 4:15 p.m.. The examiner can also be reached on alternate Fridays from 6:45 a.m. - 3:15 p.m.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Gregory Morse can be reached at (571) 272-3838.

Any response to this action should be mailed to:

Commissioner of Patents and Trademarks Washington, DC 20231

Or faxed to:

(703)746-7239 (for formal communications intended for entry)

Or:

(571)273-3841 (Examiner's fax, for informal or draft communications, please label "PROPOSED" or "DRAFT")

Application/Control Number: 09/754,863
